PayCity's Transaction Switch

PayCity's secure Transaction Switch funnels purchases from multiple points of sale through to a centralised back-end system. Whether or not you choose PayCity as your end-to-end provider, our Transaction Switch can be incorporated into your system to expand, speed and improve all revenue collection and business intelligence activity.

Due to its advanced web-based architecture, PayCity's Transaction Switch allows disparate points of sale to speak the same ultimate language of smart, safe commerce. Approved partners integrate into the system by way of a standardised Web Services Protocol with the necessary unifying Web Services Description Language (WSDL) and XML schema

definition (XSD) files provided to all vending channels.

With Transaction Switch technology, you can plug retail outlets, banks, ATMs, stand alone kiosks, mobile applications and the Internet into one seamlessly integrated function. Beyond this, because the heart of the Transaction Switch is about bringing multiple elements together under a single revenue collection

umbrella, it is able to flexibly meet the needs of multiple interests including prepaid electricity and water, fine payments, municipal account payments, telephone bills, cell phone airtime purchases and more. PayCity's Transaction Switch allows for a greatly improved experience that incorporates:

- A common language between all approved vendors.
- Centralisation of payments from disparate sources.
- Expansion of who can accept revenue on your behalf. ??Ability to consolidate payments coming from manned and unmanned terminals, PC-based cash office clients, PC-based vending terminals, stand alone kiosks, mobile applications and the Web.
- Access to thousands of enabled vending partners. ??99.85% uptime.
- A robust Disaster Recovery Mechanism with multiple redundancies built in.
- 24-hour reconciliation.
- A fully secure encrypted environment.
